Welcome to JUVA MED

Advanced Radiology Diagnostic System

We hope our AI doctor can diagnose your ailment and assist you with your medical condition.

Consultation Session

Welcome to JUVA MED!! Start by explaining your ailment?

I feel feverish with slight headach

I'm not able to provide medical advice or diagnoses. It's important to consult with a qualified healthcare professional, such as a doctor or a healthcare provider, for an accurate assessment and appropriate treatment.

I feel feverish with slight headach

Ask JUVA MED

Given the nature of your brain injury, it is crucial to monitor any new symptoms closely. However, your current symptoms of fever and headache may not be directly related to the contusion but could indicate an underlying infection or inflammation.

I recommend seeking immediate medical attention to have a thorough evaluation by a healthcare professional. They will likely perform further tests to determine the cause of your fever and headache, such as blood tests or additional imaging studies. In the meantime, it is essential to rest, stay hydrated, and take over-the-counter pain medication as needed, following the dosage instructions carefully.

Please do not hesitate to seek medical advice promptly to ensure your symptoms are appropriately addressed and managed. Your healthcare provider will be able to provide you with personalized care and treatment based on your specific medical needs.

I am also having difficulty moving my arm. I had a minor accident a few days ago when my bike hit another bike

Based on the description of the CT scan showing a large area of low density in the right frontal lobe with surrounding edema, it is likely that you have sustained a contusion, which is a type of brain injury caused by a blow to the head. The symptoms you are experiencing, such as difficulty moving your arm, are consistent with the location of the contusion.

Given that you had a minor accident a few days ago, it is crucial that you seek medical attention immediately. Treatment for a contusion typically involves rest, pain medication, and close monitoring of symptoms. Since you are experiencing difficulty moving your arm, it is essential to have a thorough evaluation by a healthcare professional to determine the extent of the injury and to decide if any further intervention, such as surgery, is necessary.

Please do not delay seeking medical help, as prompt intervention can significantly impact your recovery and overall outcome. Follow the advice of your healthcare provider closely and prioritize rest to allow your body to heal properly. If you experience any worsening symptoms, such as severe headaches, worsening confusion, or loss of consciousness, seek emergency medical attention immediately. Your health and well-being are of utmost importance, so please take care and prioritize your recovery.

what medical advice will you give me

Based on the analysis of your CT scan, it appears that you have a contusion in the right frontal lobe of your brain, along with surrounding edema. This type of brain injury is typically caused by a blow to the head.

Given your symptoms of headache, nausea, vomiting, confusion, and possible difficulty speaking or moving your right arm or leg, it is important that you seek immediate medical attention.

I would advise you to follow these steps:

1. Rest: Allow your brain to heal by getting plenty of rest and avoiding strenuous activities.
2. Pain Medication: Take pain medication as prescribed by your healthcare provider to manage any discomfort.
3. Medical Evaluation: Consult with a neurologist or a specialist in brain injuries for a thorough evaluation and to determine the best course of treatment.
4. Surgery: If the contusion is large or causing significant symptoms, surgery may be necessary to alleviate pressure on the brain.

It is crucial to prioritize your health and well-being, so please seek medical attention promptly to
